

IntentConfirm

Clearer requirements
inside your AI coding workflow

An open-source Skill for the host model

IBM Bob 2.0 Hackathon

Ambiguity before implementation

“Build me a personal study tracker.”

One request leaves choices that change the code.

Daily study sessions

Time spent and daily activity

Reading progress

Chapters and completion

Notes and tags

Target workflow: clarify requirements before an AI changes or creates code.

The clarification workflow

01

Keep explicit constraints

Preserve what the user has already said.

02

Ask about consequential gaps

Offer a few concrete choices and allow free text.

03

Make defaults visible

Use scoped, reversible defaults when the user delegates.

04

Continue with implementation

Use the agreed brief in the same AI conversation.

Clear, bounded requests can proceed without extra questions.

Real Bob session: four choices

Decision	User choice
What to record?	B Reading progress
Where to save it?	A Browser localStorage
How to use it?	A A single HTML file
What happens after completion?	C Let the assistant decide

English paraphrase of the actual Chinese conversation. User replies: “BAA”, then “C”.

The brief and the delivered example

User-selected requirements

Reading progress
Chapters and completion
percentage
Browser localStorage
One HTML file

Delivered features

Add and update learning
resources
Keep completed items as history
Show progress visually
Save data between visits

<examples/study-log-demo/index.html>

The user opened the result and reported that it met their expectations. One case, not a benchmark.

Requirement changes keep their history

Optional record tools

Changed decision

New candidate with the new user evidence

Dependent decisions

Mark affected accepted decisions as stale

Unrelated constraints

Keep existing decisions unchanged

Structure and quote checks support review. The host AI and user still judge meaning.

IBM Bob in development and use

Contributor	Work in this project
IBM Bob	Clarification engine, update tool and tests
IBM Bob with the user	Real clarification session and study-log example
Codex	Initial prototype, Skill packaging and later repairs
User	Product direction, choices and result acceptance

Bob’s original reports and the later Codex audit remain separate project records.

Current evidence and next evaluation

38

Skill Python tests passed

Evidence handling, dependency updates and safe file writes

1

Real Bob use case accepted

User choices followed by a working example they accepted

Next: compare matched tasks for clarification effort, requirement misses and rework.

Broader host compatibility and average productivity gains have not yet been measured.
